STATEMENT

ONE CITY GETS BUILT IN CONCRETE. THE OTHER GETS BUILT IN *an engine.* I DO BOTH.

Six years across design practice, museum fabrication and government simulation. On Saadiyat Island I took three museums from design surface to cast panel — production 3D, GRC sheets, steel shop drawings, then the factory floor. A curved monument has to be cast flat, tracked, trucked and re-assembled true, and that is a geometry problem before it is anything else.

In Abu Dhabi I build the **UAE's national digital twin**: seven emirates modelled, textured, geolocated and running in real time in Unreal Engine, with an Arabic-first operational layer sitting on top of them. Not a fly-through — a working picture of a country, accurate enough to be simulated against.

Before the Gulf: regeneration for UNDP in Tripoli, heritage diagnosis on an 1878 monastery, competitions for Erbil, and a virtual-reality complex argued from a survey before a line was drawn. The through-line is the same at every scale — **build it accurately enough that it can be tested, not just admired.**

CHAPTER ONE · FLAGSHIP

UAE DIGITAL TWIN

A national-scale digital twin of the United Arab Emirates, running in real time in **Unreal Engine**. I build the cities themselves — modelled in 3ds Max, textured in Substance, delivered through Datasmith, geolocated against GIS.

CLIENT	EMPLOYER	SCOPE	STATUS
UAE MINISTRY OF INTERIOR	TAHALUF AL EMARAT	SEVEN EMIRATES · NATIONAL SCALE	IN ACTIVE DEVELOPMENT

1.1

THE PIPELINE

SATELLITE → GIS → 3DS MAX → DATASMITH → UNREAL

Every city in the twin goes through the same disciplined route, built for **speed, consistency and real-time performance** at urban scale. When a landmark matters it is rebuilt properly: grey massing to fully textured, night-lit asset.

01

SATELLITE / GIS

Imagery and footprints, georeferenced to the real coordinate frame

02

2D EXTRACTION

Clean building outlines, district by district

03

3D LOW-POLY

LOD 100–200 massing, modelled in 3ds Max

04

Box mapping · custom and emissive maps in Substance

05

DATASMITH

Pivots, naming, tags and collision, ready for engine

06

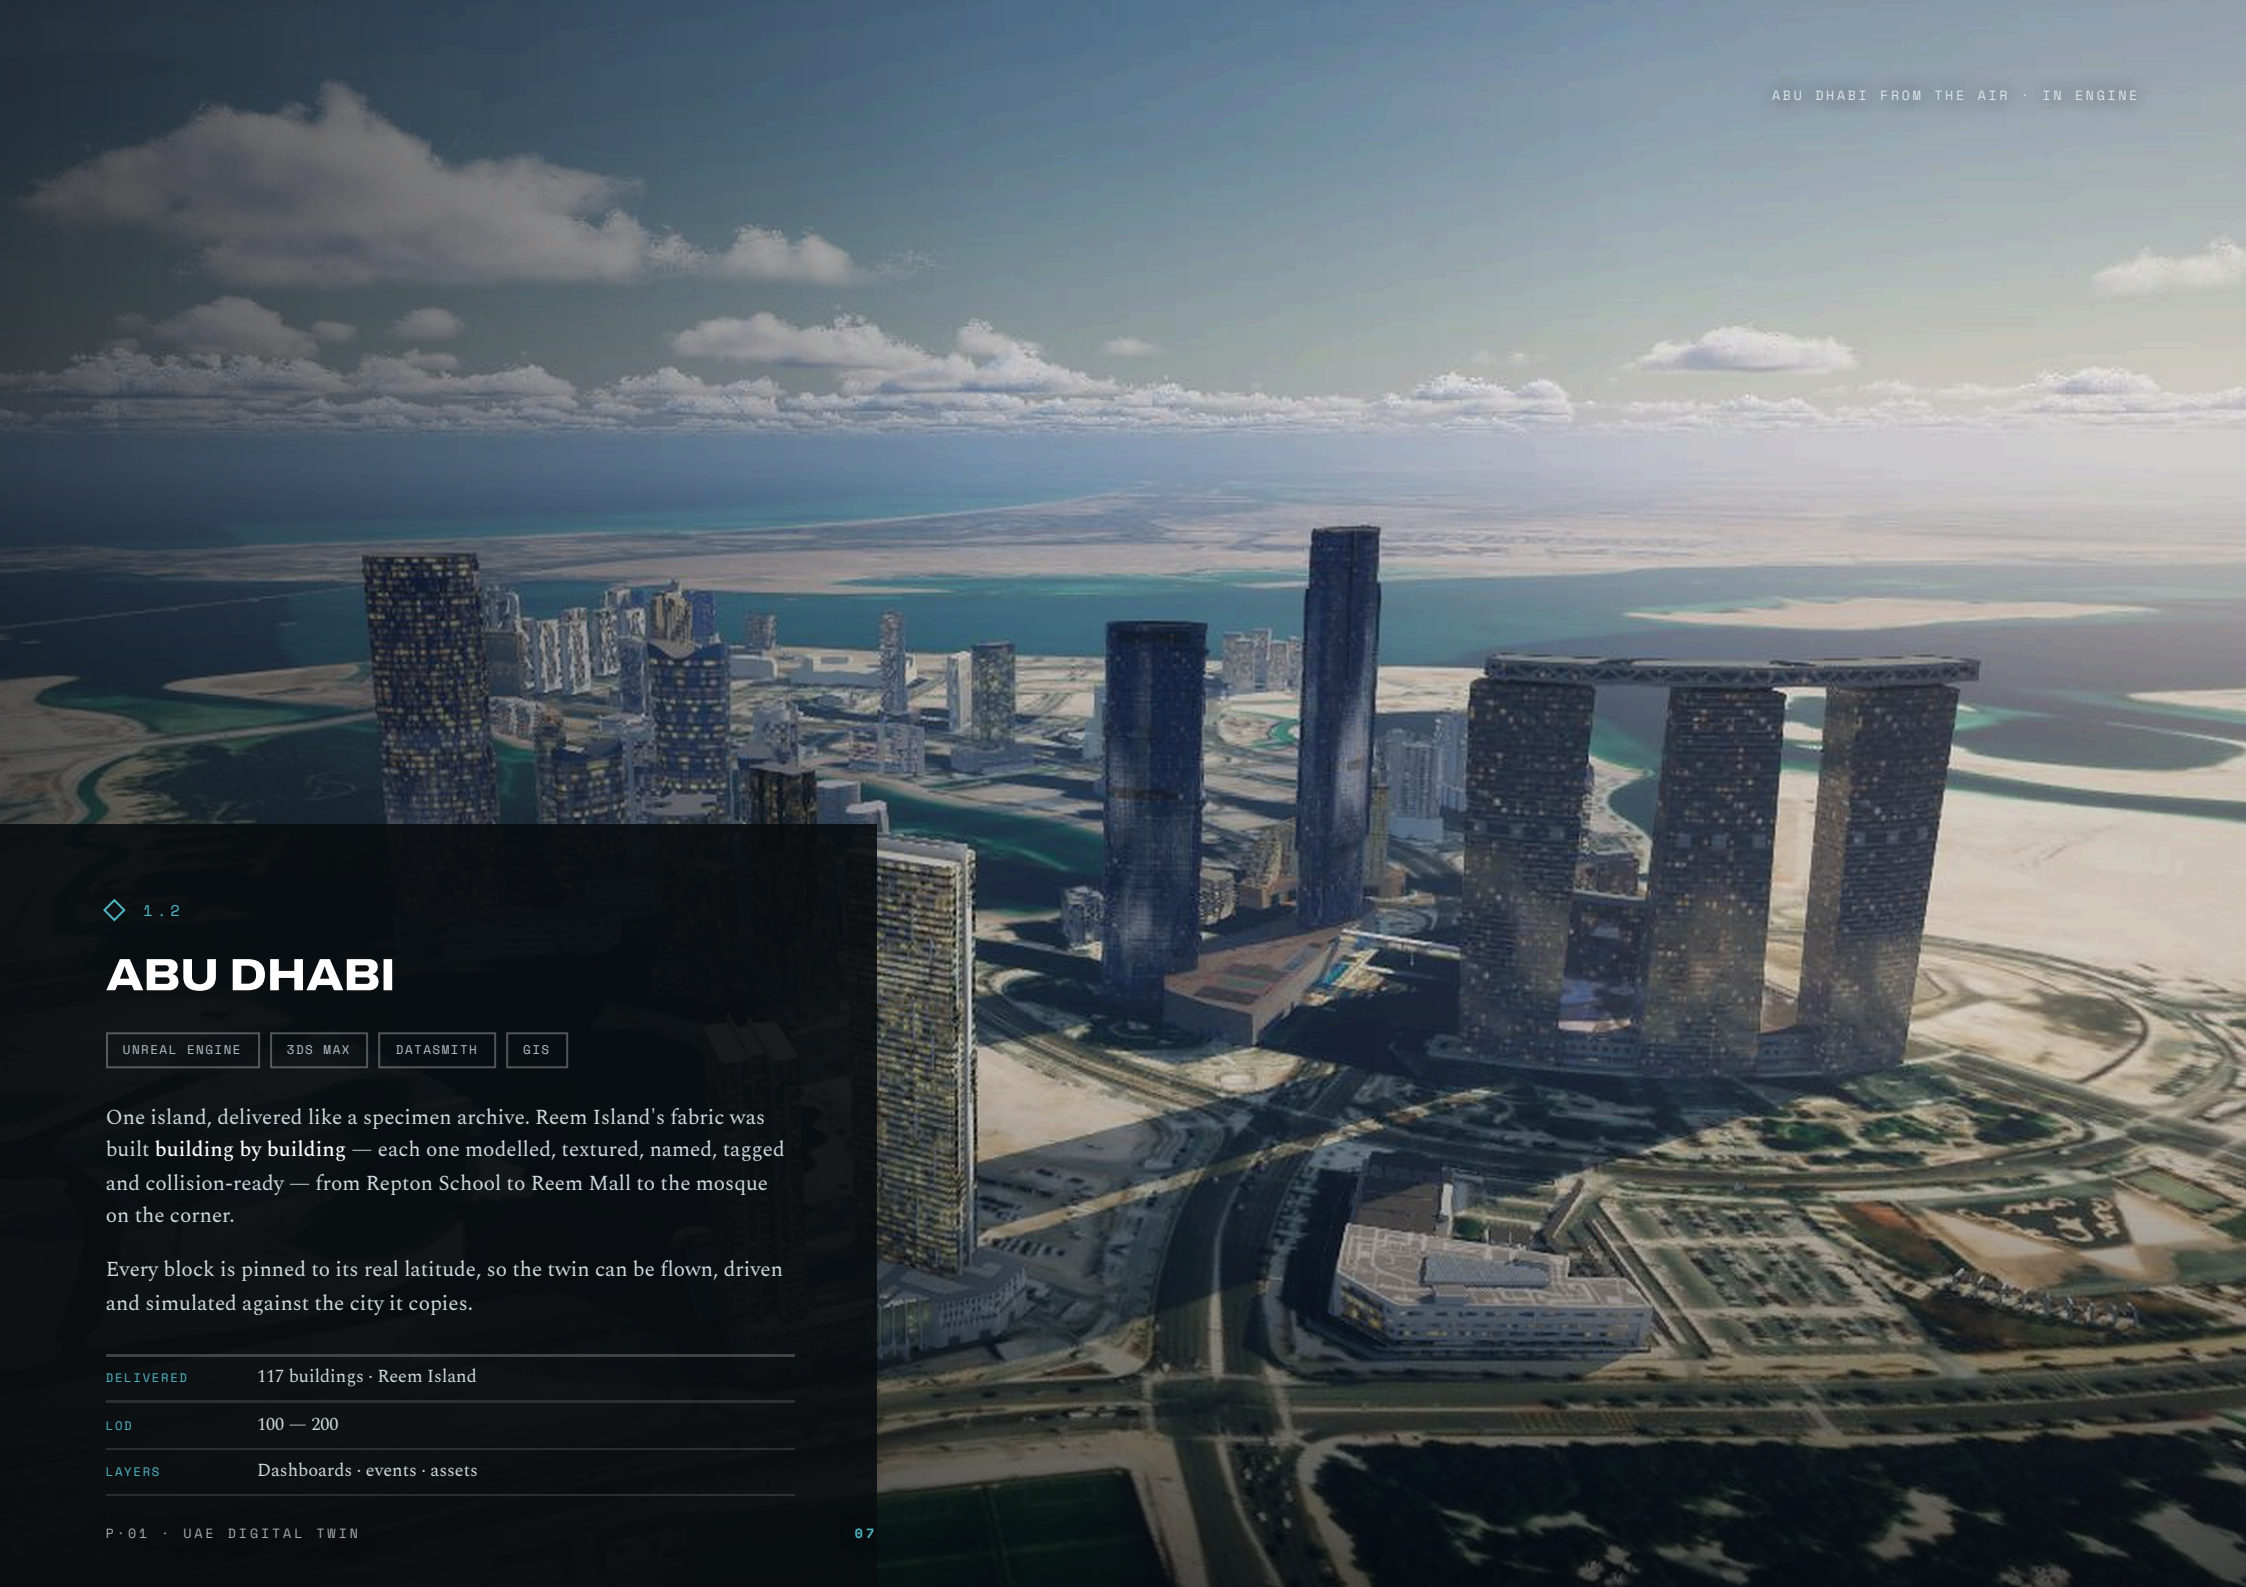
UNREAL ENGINE

Geolocation · blueprints · events · the dashboard layer

THE SAME BUILDING, TWICE — GREY MASSING TO NIGHT-LIT ASSET

SIGMA & OMEGA TOWERS · MASSING → TEXTURED NIGHT ASSET

MANGROVE COMPLEX · EXPLODED TEXTURE SET → ASSEMBLED



ABU DHABI FROM THE AIR · IN ENGINE

1.2

ABU DHABI

UNREAL ENGINE | 3DS MAX | DATASMITH | GIS

One island, delivered like a specimen archive. Reem Island's fabric was built **building by building** — each one modelled, textured, named, tagged and collision-ready — from Repton School to Reem Mall to the mosque on the corner.

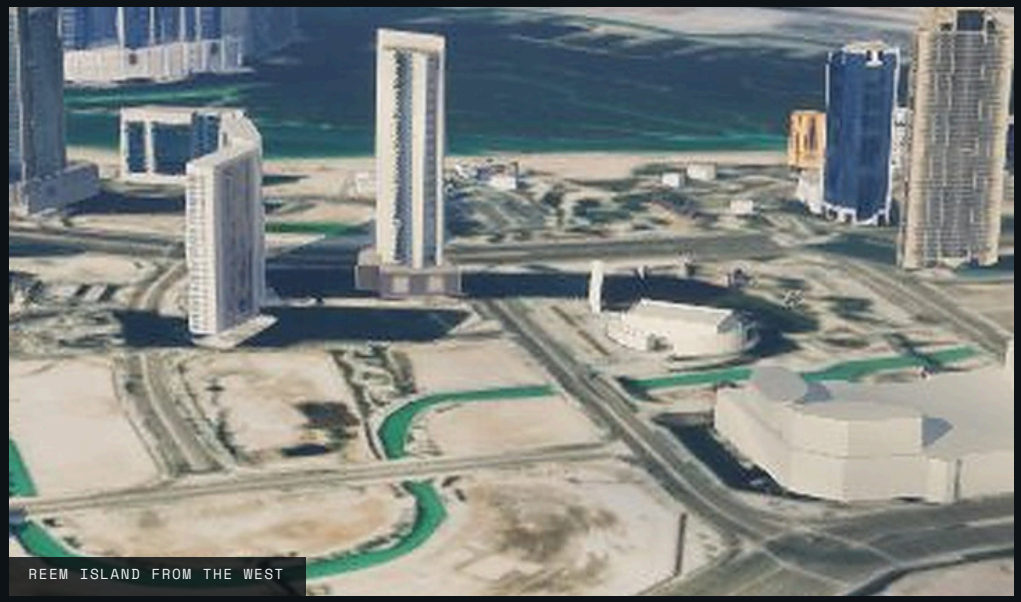
Every block is pinned to its real latitude, so the twin can be flown, driven and simulated against the city it copies.

DELIVERED	117 buildings · Reem Island
LOD	100 — 200
LAYERS	Dashboards · events · assets

1.2

THE ISLAND, BLOCK BY BLOCK

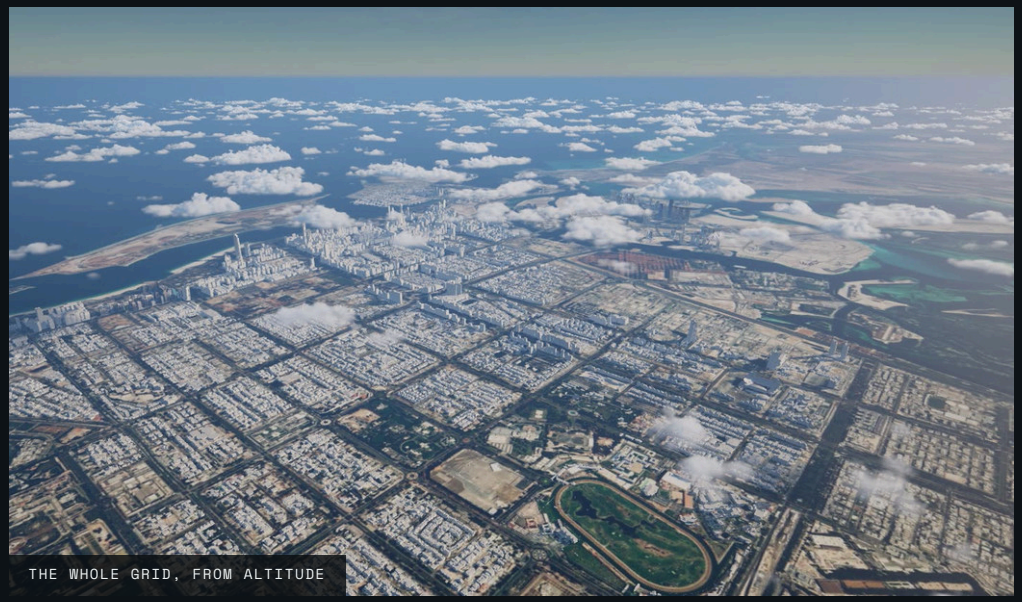
The same disciplined route runs under every city in the twin: footprint extraction, low-poly massing, UV and texture, Datasmith delivery, then geolocation and blueprints in engine. What comes out is not a fly-through — it is a place with coordinates.



REEM ISLAND FROM THE WEST

STREET LEVEL · THE REEM MALL FRONTAGE

AL MARYAH ISLAND



THE WHOLE GRID, FROM ALTITUDE

THE ASSET VAULT

All eighteen named Reem Island buildings, pulled straight from the delivery archive. Each one is a real engine asset — materials, night lights, collision, pivot and tag — not a massing block standing in for one.

AJMAN FROM THE AIR · IN ENGINE

1.3

AJMAN

REALITY CAPTURE | TRAFFIC SPLINES | INTERIORS

The northern city rebuilt from the corniche inland — **same buildings, same signage lines, same kerb geometry**, now simulation-ready with traffic splines and asset markers.

Deeper than façades: the museum fort and its heritage souk are walkable spaces in the twin, and the post office is modelled inside as well as out.

DEPTH	Exteriors + interiors
LAYERS	Traffic simulation · asset markers
EXTENT	Corniche → market district

ONE SEAM APART

AJMAN, UAE · THE PHOTOGRAPHED STREET AND THE SAME STREET IN ENGINE, SPLIT DOWN THE MIDDLE

NOTHING APPROXIMATED

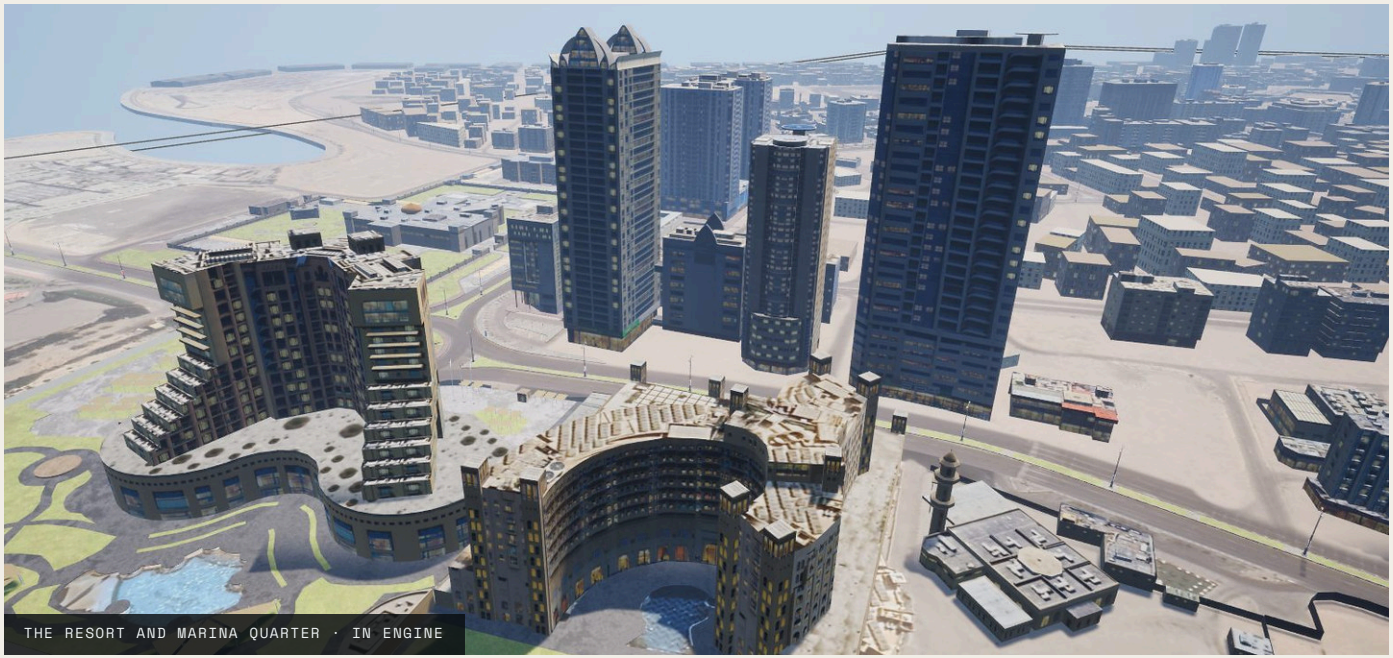
The proof sits in a single frame. On one side of that seam is the real Ajman corner; on the other, the same corner inside the engine. The tower spacing, the shop signage, the kerb radius and the palm line all carry through.

That is the whole test of a twin. A fly-through only has to look right from one camera. A simulation has to hold up when a vehicle turns the corner, when a crowd is routed down the pavement, when an incident is placed on the roundabout and the model has to answer for it.

So the city is built to be walked into, not admired from altitude — dhow monument, market blocks, marina quarter, each one carrying its real position.

METHOD	Photo survey · georeferenced
OUTPUT	Simulation-ready street
DEPTH	Exterior and interior

THE DHOW MONUMENT · REBUILT WHERE IT STANDS

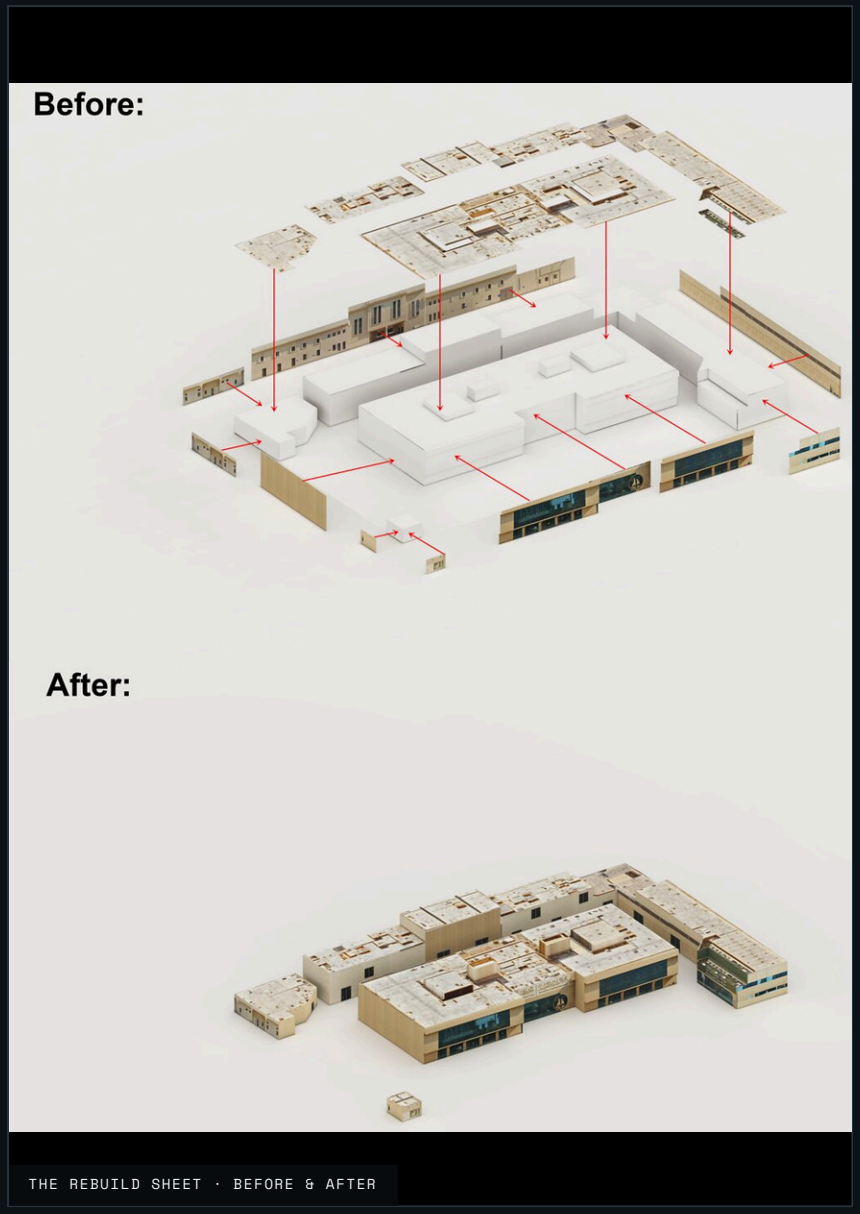


THE RESORT AND MARINA QUARTER · IN ENGINE

1.3

ONE BUILDING, THREE WAYS

A municipality building on a street in Ajman, taken through the whole route in one sheet: the photograph, the massing, the textured asset. Put the three states beside each other and **any drift shows immediately** — a window band in the wrong place, a parapet a storey too high, a colour that never stood on the street.



THE REBUILD SHEET · BEFORE & AFTER

REALITY · PHOTOGRAPHED ON THE STREET

THE TWIN · STANDING IN ENGINE

1.3

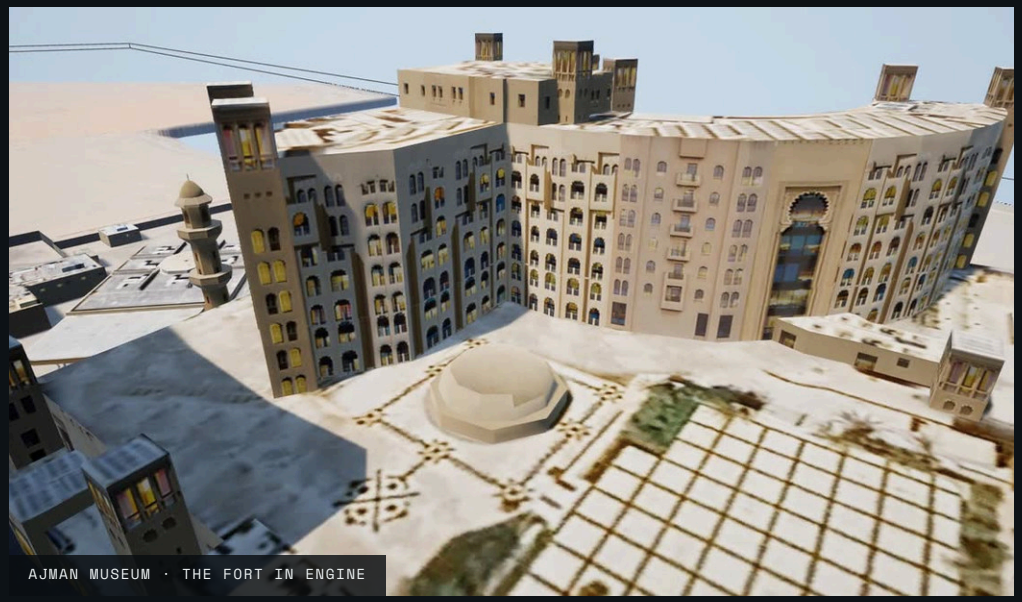
INSIDE THE TWIN

Where it matters, the twin goes indoors. The post office is modelled inside as well as out, and the museum fort and its heritage souk are walkable rooms rather than façades with nothing behind them.

AJMAN POST OFFICE · TRAFFIC SIMULATION LAYER

…AND INSIDE IT — INTERIORS ARE IN THE TWIN TOO

THE HERITAGE SOUK · WALKED IN ENGINE



AJMAN MUSEUM · THE FORT IN ENGINE

1.4

RAS AL KHAIMAH

GIS FOOTPRINTS | COASTAL STRIP | LAGOON

The northern emirate, rebuilt from the mountains to the lagoon. **The corniche, the market district and the coastal strip** — every block extracted from GIS footprints, massed, textured and pinned to its real latitude.

CHAPTER TWO · FLAGSHIP

02

MUSEUMS, FABRICATED

Three Saadiyat museums taken from design surface to cast panel at **Fibrex Construction Group** — production 3D, GRC panel drawings, steel shop sheets and point verification, then onto the factory floor.

EMPLOYER	SITE	YEARS	SCOPE
FIBREX CONSTRUCTION GROUP	SAADIYAT ISLAND · ABU DHABI	2022 – 23	PRODUCTION 3D · GRC · SHOP DRAWINGS

2.1

ZAYED NATIONAL MUSEUM

PRODUCTION 3D | STEEL WINGS | GRC | SHOP DRAWINGS

The museum's falcon-wing towers pass through the factory as thousands of unique elements. I produced the **production 3D models, panel breakdowns and steel shop-drawing sheets** — the geometry that lets a curved monument be cast flat, tracked, trucked and re-assembled on site.

The museum opened on Saadiyat in 2025.

ARCHITECT	Foster + Partners
EMPLOYER	Fibrex Construction Group
STATUS	Built · open

2.1

THE GEOMETRY BEHIND THE WING

A wing is not drawn once. It is broken into steel ribs, panel families and fixing points, each carrying its own sheet, its own number and its own tolerance.

The wing steel is modelled as it will be welded, not as it is drawn in the design model. Panels are mapped across the whole fabric so that no two neighbours share a number, and every bracket is detailed to the bolt.

Get one sheet wrong and a piece arrives on Saadiyat that fits nothing. The discipline is the deliverable.

DELIVERABLE	Production 3D · panel breakdowns

2.2

GUGGENHEIM ABU DHABI

For Gehry's colliding cones I prepared **panel production models and point-cloud verification geometry** — the survey-grade 3D that proves each cast GRC panel matches the design surface before it leaves the yard.

A GRC panel is cast against a mould, not against the building. The verification geometry closes that gap: every fixing point is carried as a coordinate, checked against the cast piece in the yard, and signed off before it is loaded.

By the time a panel reaches the crane, its position on the design surface has been proved twice — once in the production model, once on the survey table.

ON SITE · THE MUSEUM GOING UP

FROM THE WATER · THE STEPPED TERRACES

2.4

AMAALA RED SEA VILLAGE

On the Red Sea coast, a village of cellular pods. A **Grasshopper definition drives the cluster** from design surface to castable production units, so every pod can vary while staying buildable from the same family of moulds.

The definition is the deliverable as much as the render: change the shoreline and the village re-packs itself, and the pods stay castable.

That is the point of driving it parametrically. A hand-drawn cluster of a hundred cells would take a week to revise and would quietly drift out of the mould family. A definition revises in an afternoon and cannot.

SITE	Amaala · Red Sea coast · KSA
TOOLING	Grasshopper · Rhino · 3ds Max
LOGIC	One mould family, many pods
OUTPUT	Castable production units

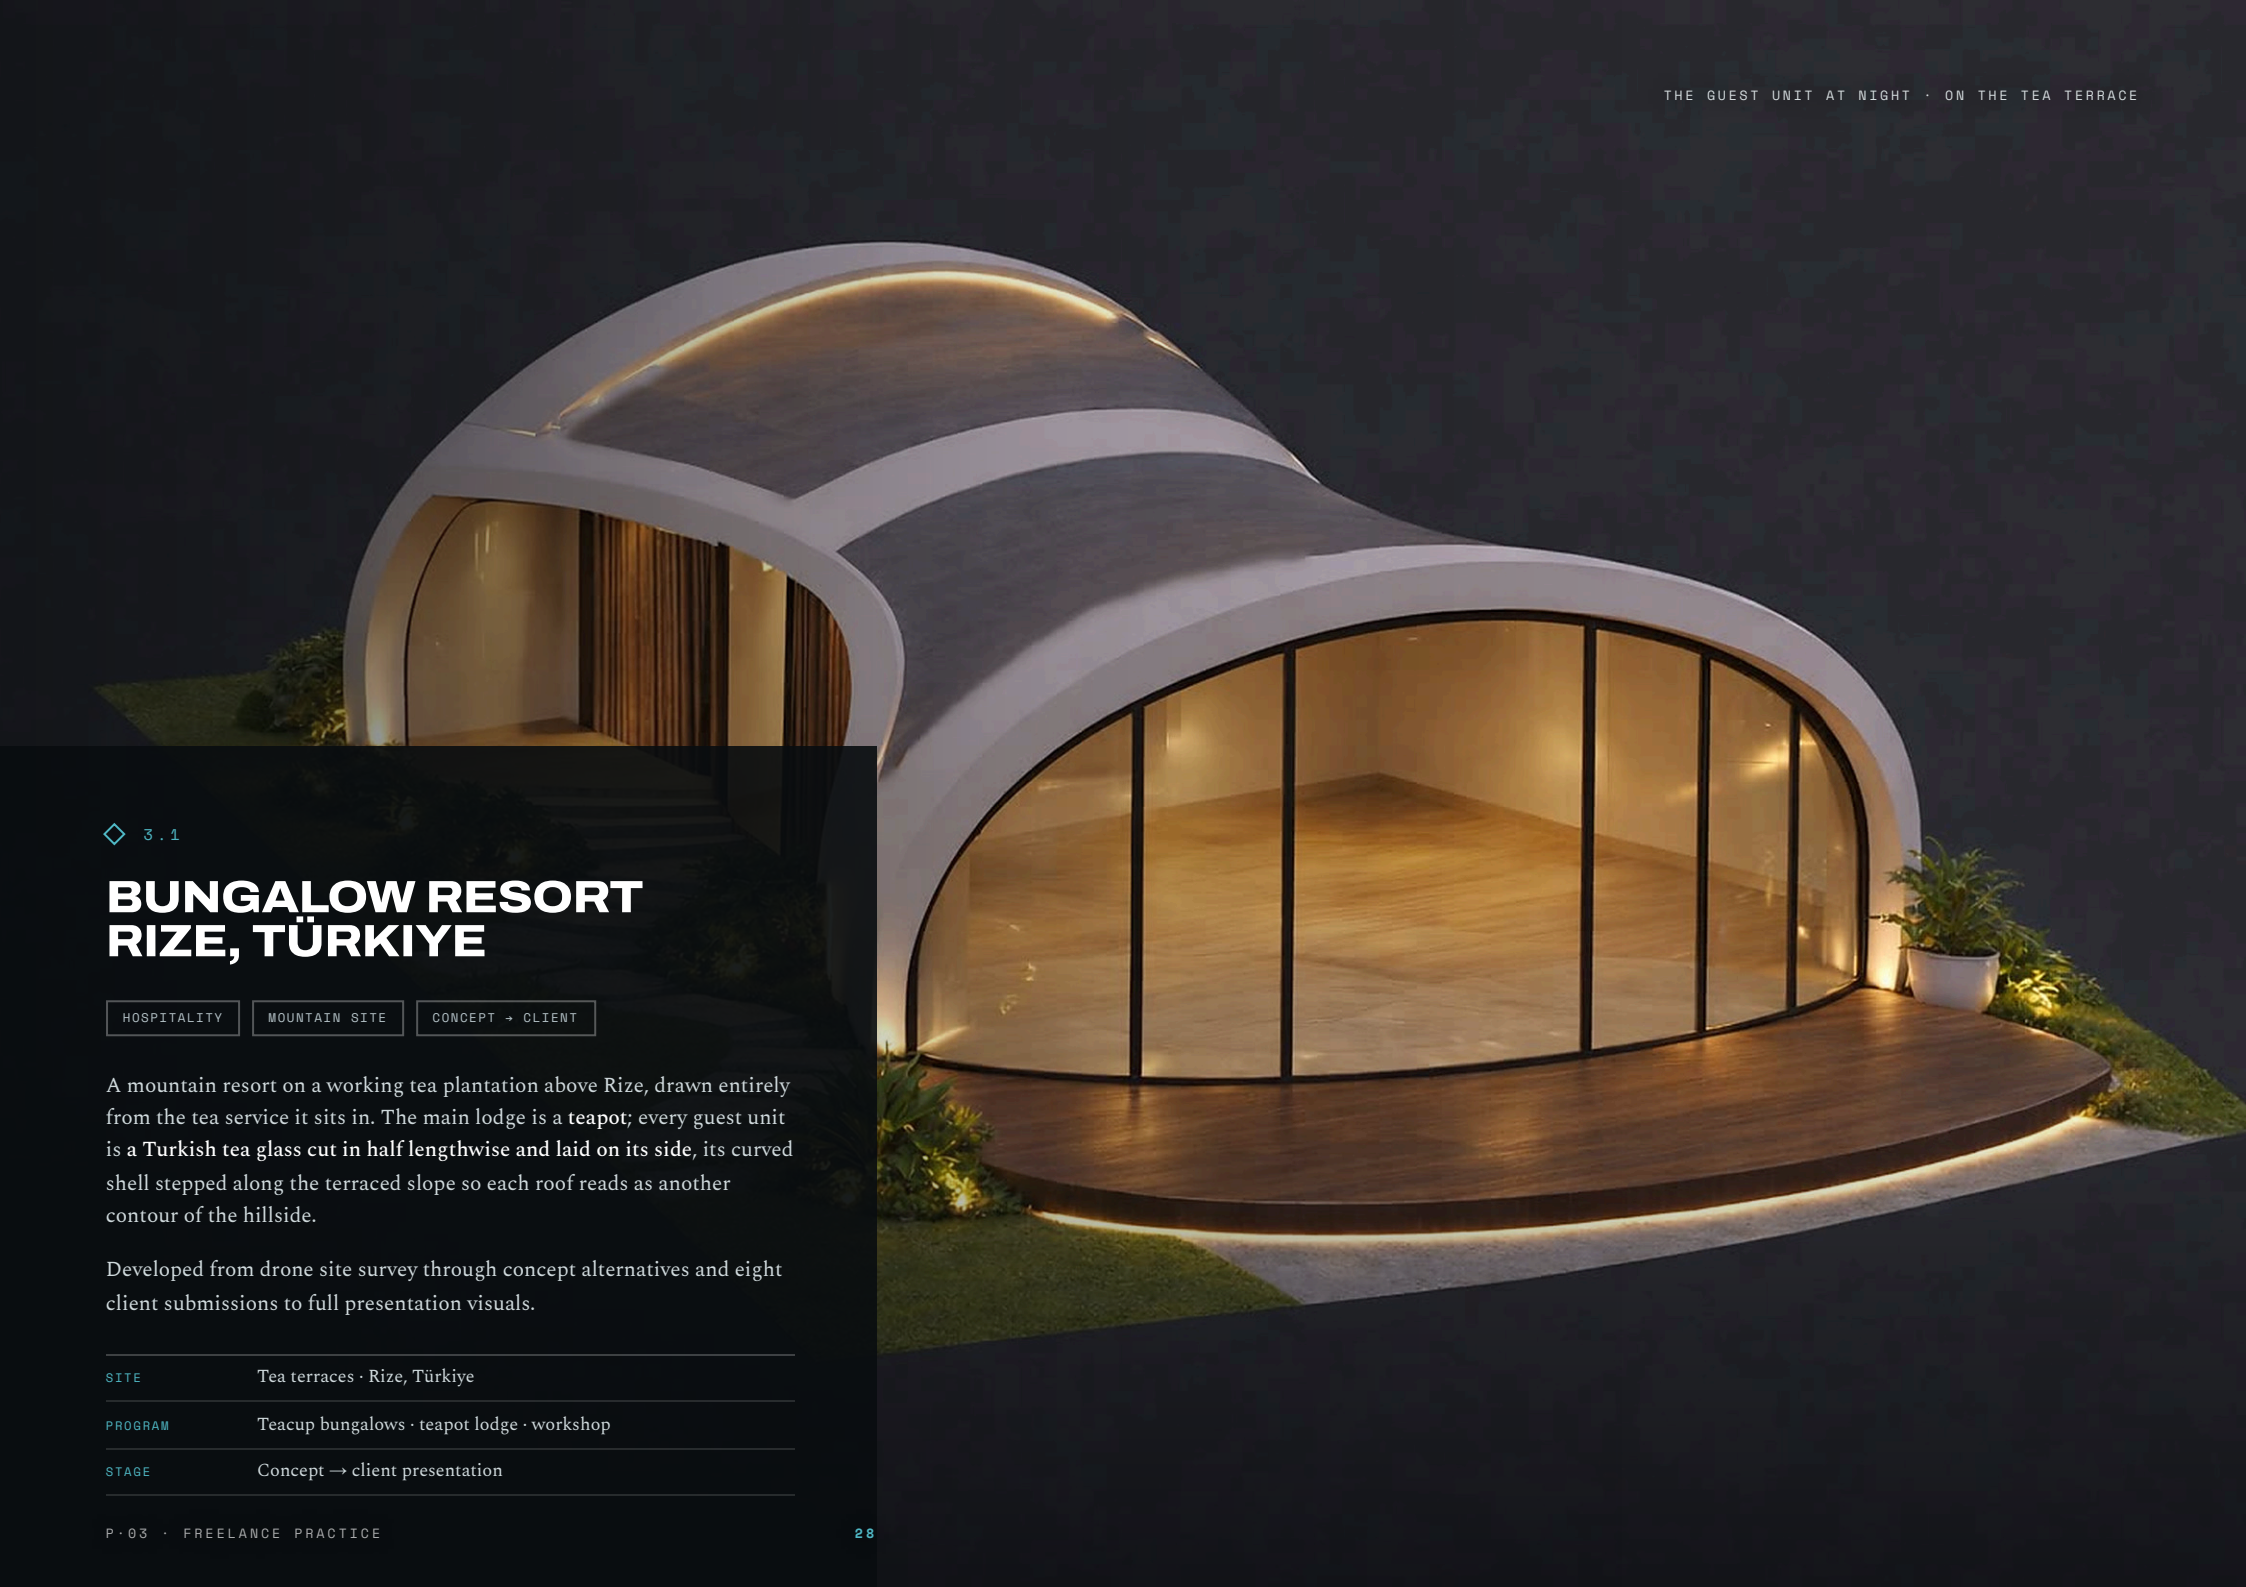
DESIGN · VISUALISATION

STAGE
CONCEPT → CLIENT PRESENTATION

PLACES
RIZE · TRIPOLI · BEIRUT



THE GUEST UNIT AT NIGHT · ON THE TEA TERRACE

◇ 3.1

BUNGALOW RESORT RIZE, TÜRKIYE

HOSPITALITY | MOUNTAIN SITE | CONCEPT → CLIENT

A mountain resort on a working tea plantation above Rize, drawn entirely from the tea service it sits in. The main lodge is a **teapot**; every guest unit is **a Turkish tea glass cut in half lengthwise and laid on its side**, its curved shell stepped along the terraced slope so each roof reads as another contour of the hillside.

Developed from drone site survey through concept alternatives and eight client submissions to full presentation visuals.

SITE	Tea terraces · Rize, Türkiye
PROGRAM	Teacup bungalows · teapot lodge · workshop
STAGE	Concept → client presentation

3.1

THE HILLSIDE, TWICE

The plot was flown before it was drawn. The drone survey set the terrace lines, and the units were plotted straight onto the frame that recorded them.

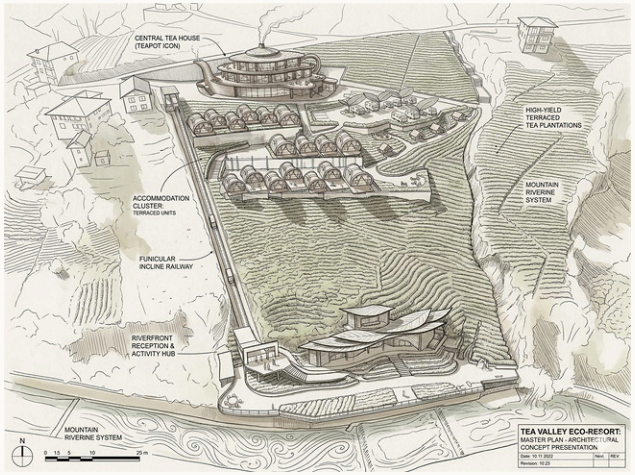
What the ground gave, the scheme kept: no terrace was cut flat to suit a building. The units sit along the contour lines the tea already follows, which is why the roofs read as another row of the plantation rather than as objects dropped on it.

The hand studies came first and stayed useful — the site strategy and the schematic master plan were what the client actually argued with, across eight submissions.

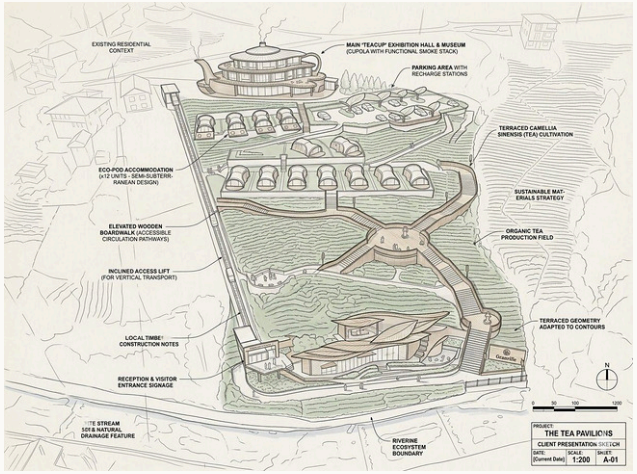
SURVEY	Drone photogrammetry
METHOD	Units plotted on the real frame
SUBMISSIONS	Eight, to the client

THE SITE AS FOUND

UNITS PLOTTED ONTO IT



MASTER PLAN · HAND STUDY



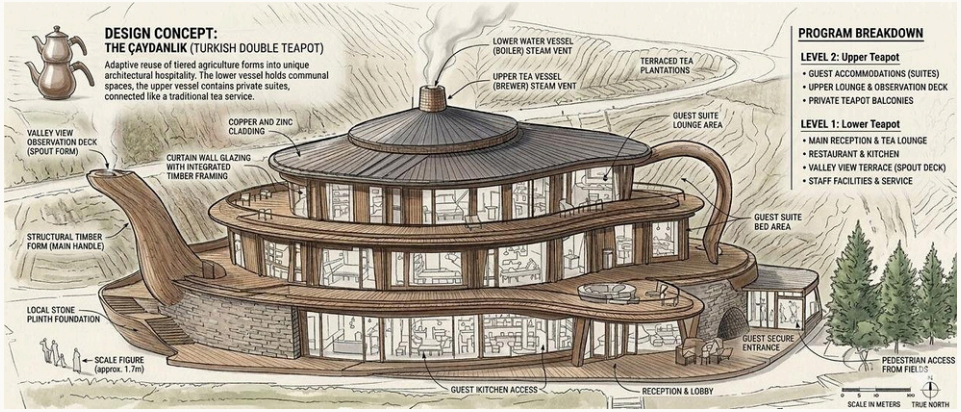
THE SCHEMATIC SKETCH

3.1

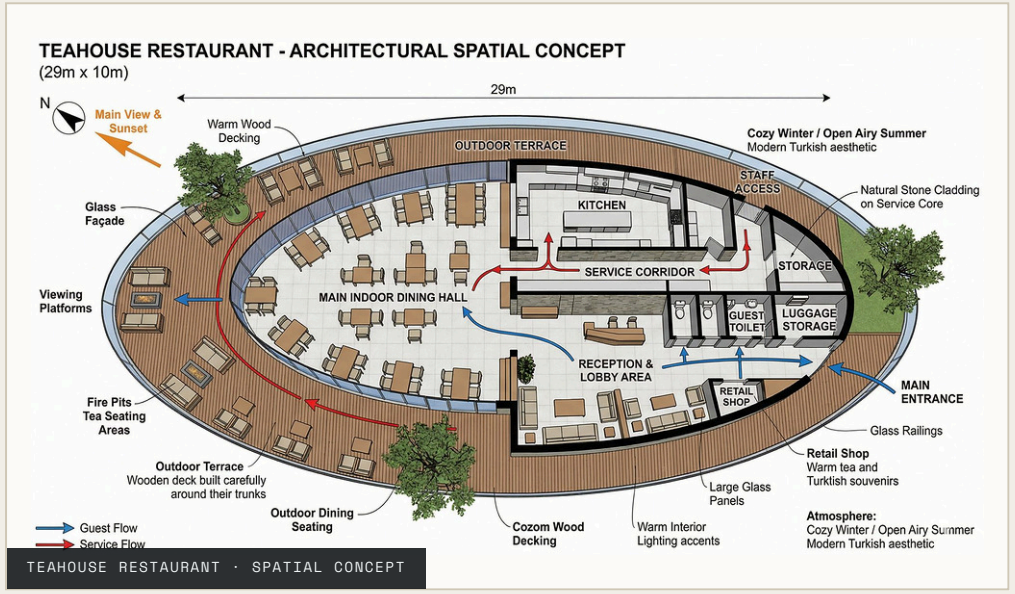
TEAPOT AND TEACUP

The concept is literal and it is drawn that way. The lodge is a teapot, cut open floor by floor; the guest unit is a tea glass halved lengthwise and laid down, its curved shell carrying a green roof into the slope.

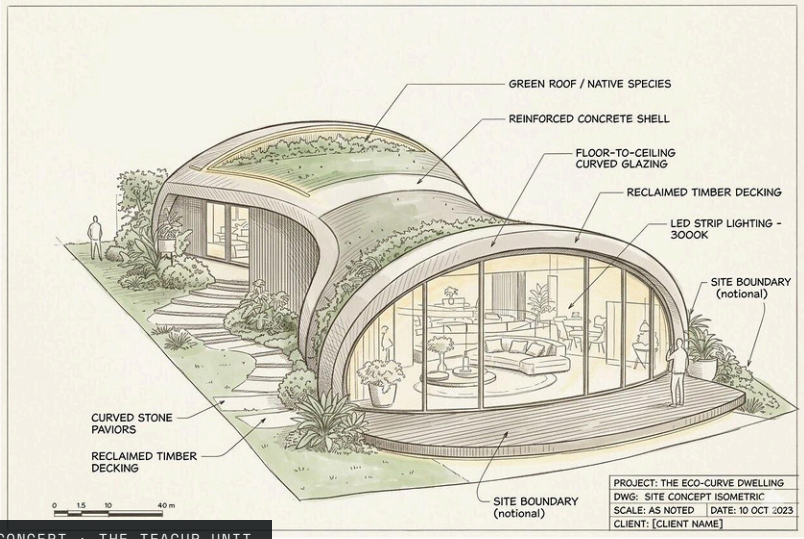
THE TEAPOT LODGE · SECTIONAL CUTAWAY



DESIGN CONCEPT · THE TEAPOT LODGE



TEAHOUSE RESTAURANT · SPATIAL CONCEPT



DESIGN CONCEPT · THE TEACUP UNIT

3.1

THE UNIT ITSELF

Cut a Turkish tea glass in half down its length, lay it on its side, and you have the unit: a curved shell that is widest at the window wall and narrows to the back of the plan.

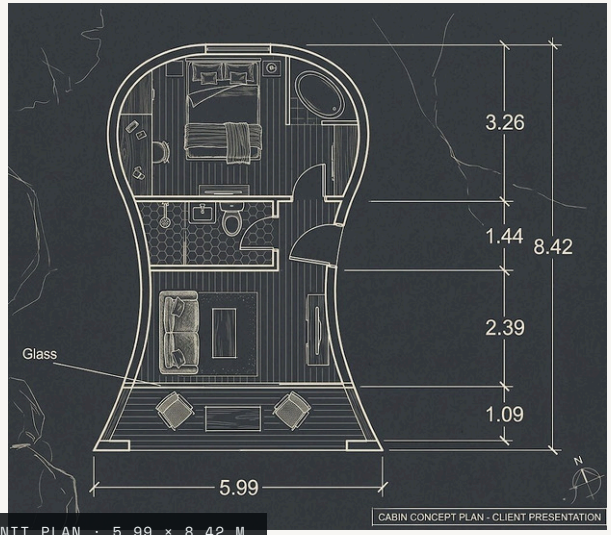
The plan keeps the glass silhouette too — the waisted **hourglass** outline of an *ince belli* glass, drawn out at 5.99 × 8.42 m for the compact unit and 6.47 × 10.03 m for the family one.

The shell is reinforced concrete under a green roof, so the unit carries the plantation over itself rather than interrupting it.

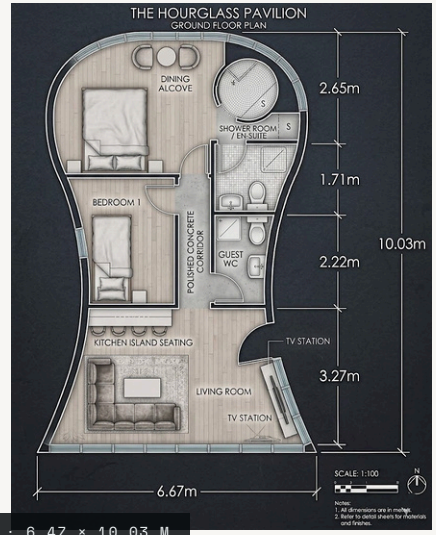
UNITS	Compact + family
ROOF	Green roof over curved shell
STRUCTURE	Reinforced concrete shell

THE UNIT FORM · A HALF TEA GLASS ON ITS SIDE

THE SHELL, FROM THE BACK



UNIT PLAN · 5.99 × 8.42 M



UNIT PLAN · 6.47 × 10.03 M

3.1

THE WORKSHOP AND THE TERRACES

The tea workshop sits lowest, on the river terrace, where the leaf comes off the slope. Above it the lodge and the units step up the plantation.

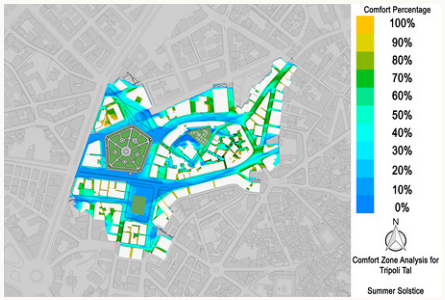
THE WHOLE DISTRICT, REBUILT

TRIPOLI · THE OTTOMAN CORE RECONSTRUCTED FROM PHOTOGRAMMETRY, THEN REGENERATED

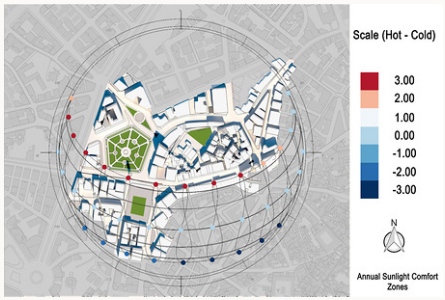
4.3

THE EVIDENCE LAYER

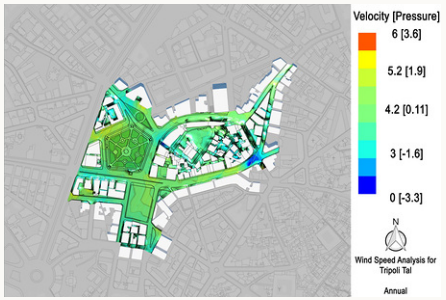
Design decisions argued with data — comfort zones, solstice shadows, wind velocity, pedestrian stay-places, commercial heat, and **algorithmically placed café locations** scored against the comfort map. Some layers were walked and counted by hand; others simulated in Grasshopper.



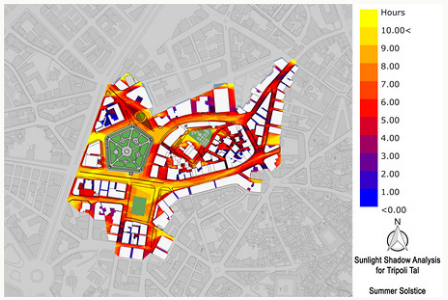
COMFORT ZONES · SUMMER



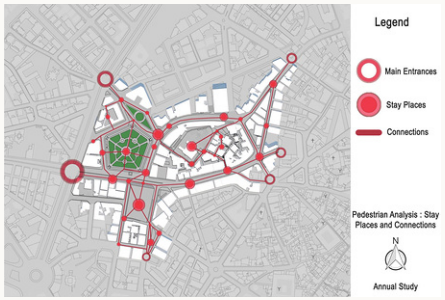
ANNUAL COMFORT



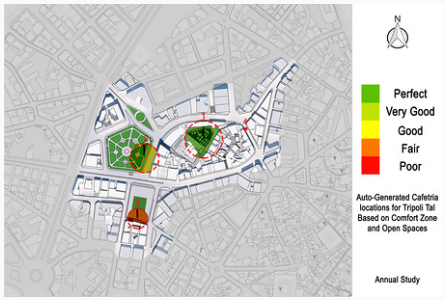
WIND VELOCITY



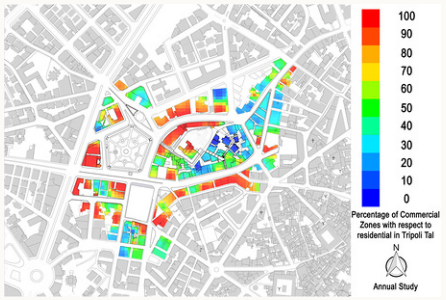
SHADOW HOURS · SOLSTICE



PEDESTRIAN STAY-PLACES



AUTO-PLACED CAFÉS



COMMERCIAL HEATMAP

PHOTOGRAMMETRY BASE · THE REAL DISTRICT

Comfort. Annual and solstice comfort maps set where a person can actually stand still in July. The planting, the colonnade and the water were placed against those maps, not against a plan drawing.

Wind and shade. Velocity and pressure across the square, and shadow-hour counts at the solstices, decided the depth of the arcade and the height of the tree canopy.

People and trade. Stay-places were walked, counted and mapped by hand; the commercial-to-residential heatmap came from the same field notes. Café positions were then generated against the comfort surface rather than chosen.

HERITAGE: TWO RECORDS

Al Mawlawiya and the old souks. Rehabilitation of the Mevlevi lodge gardens and the old souk edge in Tripoli — stone terraces, water channels and planting brought back around the historic tekke. Worked from the drawings to the ground: detailed design, bills of quantities, and supervision of the works on site.

Mar Semaan Monastery, 1878. A field diagnosis in Zghorta — walking the vaults and walls to document cracks, settlement, water infiltration and fire damage, then mapping the pathologies and recommending anchoring and tie-rod interventions to hold the stone together.
